Turn a TV into a Digital Notice Board

A structured announcement that tells everyone what changed and what to do next.

A TV announcement with title, supporting text and footer beside its phone controls. Product example.

1. Open vuthis.com on the TV or projector

Open vuthis.com in the display browser. For a projector, use its browser or the computer already connected to it. Keep the connection code on screen.

Result: The screen is ready for a controller.

2. Connect your phone, tablet or laptop

Scan the screen QR code with your phone. On a laptop or tablet, open vuthis.com/r and enter the screen code. Both devices need internet; they can use different networks.

Result: The content controls are on your device.

3. Choose Announcement and write the title

Choose Announcement. Give the notice a short title such as Session change, Welcome or Today at reception.

Result: The main point is immediately clear.

Use the controls. Check the result.

4. Add the subtitle and footer

Use the subtitle for the useful detail and the footer for a time, room or next action. For example: Workshop moved to Hall B; Follow signs upstairs.

Result: The notice has a readable information hierarchy.

5. Choose colours and check the layout

Choose readable colours. If your current product access includes an image, add one when it helps explain the notice. Preview how the words fit.

Result: The important detail stands out.

6. Show the notice and keep it current

Choose Show now. Update the announcement from the controller when plans change, then clear or replace it when it no longer applies.

Result: Visitors see the current announcement.

Keep it ready for the room

- Use title, subtitle and footer for different jobs rather than repeating the same words.

- Keep private visitor information out of public-facing notices.

Open the working product

Open vuthis.com on your display | Connect with the screen code
