Display a Now-Serving Number or Tally Counter on TV

The current number, large and labelled, with the controls kept off the public screen.

A labelled tally counter on a TV with plus, minus and Reset on a phone. Product example.

1. Open vuthis.com on the TV or projector

Open vuthis.com in the display browser. For a projector, use its browser or the computer already connected to it. Keep the connection code on screen.

Result: The screen is ready for a controller.

2. Connect your phone, tablet or laptop

Scan the screen QR code with your phone. On a laptop or tablet, open vuthis.com/r and enter the screen code. Both devices need internet; they can use different networks.

Result: The content controls are on your device.

3. Choose Counter and write the label

Choose Counter. Add a label such as Now serving, Places remaining, People checked in or Items collected.

Result: The number has clear context.

Use the controls. Check the result.

4. Set the starting value and Step

Choose where the count begins. Set Step to the amount added or subtracted by one tap: one for individuals or a larger value for batches.

Result: Each tap has the intended effect.

5. Choose Show now

Show the labelled counter on the TV or projector. Keep the increment, decrement and reset buttons on the controller.

Result: The room sees one clear current number.

6. Count up, count down or Reset

Use + Step or - Step as events happen. Reset returns to your chosen starting value. Check the display before calling the next turn.

Result: The screen follows the operator count.

Keep it ready for the room

- The feature displays one labelled tally. It is not an automated ticketing system or a two-team sports scoreboard.

- Choose a starting value and Step that match the job before making it public.

Open the working product

Open vuthis.com on your display | Connect with the screen code
