Show a PDF on TV or a Projector Without HDMI

A clean PDF on the display, with page changes controlled from your device.

A programme PDF displayed on TV with Previous, Next and view controls on a phone. Product example.

1. Open vuthis.com on the TV or projector

Open vuthis.com in the display browser. For a projector, use its browser or the computer already connected to it. Keep the connection code on screen.

Result: The screen is ready for a controller.

2. Connect your phone, tablet or laptop

Scan the screen QR code with your phone. On a laptop or tablet, open vuthis.com/r and enter the screen code. Both devices need internet; they can use different networks.

Result: The content controls are on your device.

3. Choose Document and select your PDF

On the connected controller, choose Document and select the PDF you want to present. Check that it is the intended document.

Result: The PDF is selected on the controller.

Use the controls. Check the result.

4. Tap Show now to display the PDF

Choose Show now. The PDF appears on TV or the projector while its controls remain on your phone or laptop.

Result: The audience sees the document.

5. Use Fit page or Fit width

Fit page keeps the complete page visible. Fit width enlarges a tall page for reading. Choose the view that makes the important text legible.

Result: The page is framed for your audience.

6. Turn pages from your phone or laptop

Use Previous and Next. In Fit width, the controls move through a tall page a screenful at a time before changing pages.

Result: You can present the document at your own pace.

Keep it ready for the room

- Use a standard, unprotected PDF. Export password-protected material to an authorised unprotected copy before selecting it.

- For a portrait document, compare Fit page with Fit width from the audience position.

Open the working product

Open vuthis.com on your display | Connect with the screen code
