PowerPoint, Google Slides and Keynote on TV Without HDMI

Slide pages on the room screen. You decide when the next one appears.

Slide-style PDF pages on a TV with a separate controller. Product example.

1. Open vuthis.com on the TV or projector

Open vuthis.com in the display browser. For a projector, use its browser or the computer already connected to it. Keep the connection code on screen.

Result: The screen is ready for a controller.

2. Connect your phone, tablet or laptop

Scan the screen QR code with your phone. On a laptop or tablet, open vuthis.com/r and enter the screen code. Both devices need internet; they can use different networks.

Result: The content controls are on your device.

3. Export your presentation as PDF

In PowerPoint, Google Slides, Keynote or Canva, export or download the presentation as PDF. Check the exported page order and layout.

Result: Your presentation is ready as a PDF.

Use the controls. Check the result.

4. Choose Document, then Show now

Select the exported slide PDF in Document and choose Show now. The presentation pages appear on the shared screen.

Result: The first slide page is on the display.

5. Choose Fit page for complete slides

Use Fit page so the entire slide is visible. A landscape presentation usually suits a widescreen TV or projector.

Result: The whole slide is visible.

6. Advance the slide pages as you present

Use Previous and Next on the controller. Keep notes and other device activity on your laptop or phone while the room sees the selected PDF.

Result: The presentation moves at your pace.

Keep it ready for the room

- PDF export shows static slide pages. Animations, transitions and embedded video are not carried through this route.

- Before the meeting, open the exported PDF to check fonts, image placement and slide order.

Open the working product

Open vuthis.com on your display | Connect with the screen code
